INTRODUCTION

WHAT IS A TIME SERIES?

Time Series

A time series is a collection of observations of one or more variables ordered in time. We denote a time series by $\{x_t\}_{t \in \mathcal{T}}$, with \mathcal{T} being the index set of time periods or time points.

INTRODUCTION

WHAT IS A TIME SERIES?

- Typical examples of the set \mathcal{T} are:
 - years: $\mathcal{T} = \{1998, 1999, \dots, 2016\}$.
 - quarters: $\mathcal{T} = \{01/2010, 02/2010, \dots, 04/2016\}$.
 - ...
- The chronological structure of a time series is essential and itself contains information.
- Often time series are recorded at (essentially) equidistant time points, sometimes an idealization, sometimes not tenable.
- Discrete time versus continuous time data (and models).

INTRODUCTION

WHAT IS A TIME SERIES?

- As in other fields in statistics, the values of x_t can be:
 - nominal (e. g., 'red', 'blue', 'green')
 - ordinal (e. g., 'low', 'medium', 'high')
 - discrete (e. g., $x_t \in \mathbb{N}$)
 - interval data (e. g., $x_t \in [0, 1]$)
 - real or complex valued
 - univariate or multivariate
- In this course, we focus (with the exception of the discussion of spectral analysis) on **real valued** time series:

$$x_t \in \mathbb{R}^n \quad \text{and} \quad \mathcal{T} = \{1, \dots, T\}$$

for some $T \in \mathbb{N}$ (at least after discretization).

- For many mathematical considerations, $\mathcal{T} = \mathbb{Z}$ will be used (for simplicity or beauty).

HISTORICAL TIME SERIES

WEATHER IN NEW YORK (DECEMBER 1912)

Source: Brinton (1914)

HISTORICAL BACKGROUND OF TIME SERIES ANALYSIS I

- 1789 Laplace searches for “secular changes” in the orbit of the planets and the moon.
- 1879 Stokes invents the **periodogram** that is used for the analysis of sunspot data (by Schuster, 1898) and for economic data (by Beveridge, 1921 & 1922).
- 1930–45 Cramer, Kolmogorov, Wiener and Wold develop the theory of **stationary processes**, including spectral theory, prediction and filtering, probability theory.
- 1940–50 Early heydays of econometrics: Simultaneous equation systems, identifiability and maximum likelihood estimation (Anderson, Haavelmo, Koopmans et al.).
- 1940–60 Spectral (estimation) theory by Tukey and (especially for economic time series) by Granger and Hatanaka.
- 1960 The Kalman filter and state space models.

HISTORICAL BACKGROUND OF TIME SERIES ANALYSIS II

- 1960–88 Asymptotic theory for **stationary** autoregressive and ARMA systems (Anderson, Deistler, Hannan, Walker et al.).
- 1971 The Box-Jenkins approach to fit ARIMA models for time series data.
- 1969–85 Automatic order estimation, information criteria (AIC, BIC).
- 1982 Autoregressive conditional heteroskedasticity (ARCH) models to describe (financial) time series that exhibit volatility clusters (Engle).
- 1986 Generalization of ARCH models, e. g., so-called GARCH models (Bollerslev), large zoo of variants by now.
- 1987 Cointegration (Engle and Granger): Analysis of multivariate **integrated** time series with common stochastic trends.

SOME MAIN USES OF TIME SERIES ANALYSIS

- Searching for (hidden) features such as trends, cycles or (linear) dependencies
- Preprocessing of data including seasonal adjustment or the extraction of stylized facts
- Detection of structural breaks
- Prediction
- Control/Monitoring
- Estimation of parameters (which may be theoretically meaningful: structural parameters)
- Testing of (conflicting) theories
- Testing for causality

SOME MAIN AREAS OF APPLICATION I

- Biology:
 - Modelling of plant growth
 - Prediction of bacteria population
- Economics:
 - Forecasting and policy simulations (e. g., macroeconomic variables like GDP, unemployment,...)
 - Estimation of parameters
 - Discrimination amongst competing theories
- Engineering:
 - Signal processing (speech processing, radar and sonar applications)
 - Control engineering (control of missiles, aeroplanes, ships, chemical or technical plants)
 - Monitoring (e. g., of oil platforms)
- Finance:
 - Analysis and forecasting of financial data (e. g., stock market prices, exchange rates, interest rates,...)

SOME MAIN AREAS OF APPLICATION II

- Analysis of co-movements between prices and volatility (e. g., leverage effect)
- Geophysics:
 - Exploration of natural resources (oil)
 - Prediction of earthquakes
- Medicine:
 - Analysis of EEG data
 - Estimation of intervention effects
- Meteorology and Hydrology:
 - Weather forecasting
 - Modelling stream flows of rivers
 - Prediction (and prevention) of floods

SPORTS DATA

WINNING TIMES FOR MEN'S 400M FINAL IN THE OLYMPIC GAMES 1896–1996

- Missing data during WWI (1914–18) and WWII (1939–45).
- Source: <https://datamarket.com>

SEISMOLOGICAL DATA

NUMBER OF EARTHQUAKES PER YEAR WITH MAGNITUDE 7.0 OR LARGER (1900–1998)

- No obvious pattern (no trend, no cyclical behavior) visible.
- Source: <https://datamarket.com>

GOOGLE TRENDS DATA

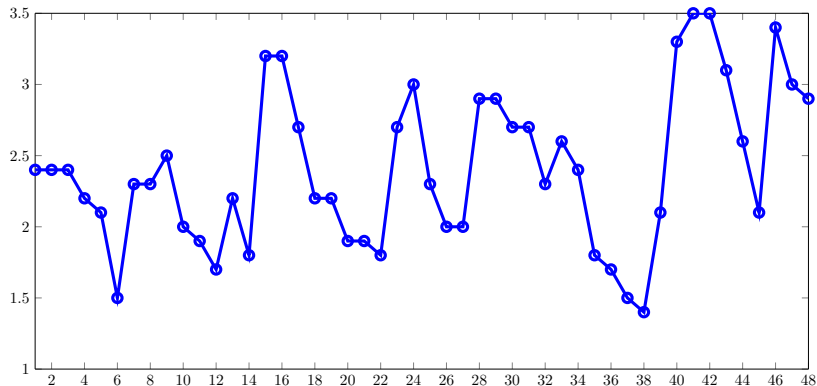

WEEKLY SEARCH VOLUME FOR “GIFT WIFE”

- Indexed series: Week with highest search volume set to 100.
- Sample period from Oct. 9, 2011 to Sept. 25, 2016.

MEDICAL DATA

LUTEINIZING HORMONE (TRIGGERS OVULATION) IN BLOOD

- Series shows 48 LH levels (blood samples from a human female) taken at 10 min intervals.
- Source: R datasets

ECOLOGICAL DATA

NUMBER OF LYNX TRAPPED IN MCKENZIE RIVER DISTRICT IN NORTHWEST CANADA

- Annual data for the period 1821–1934: Some form of cyclical behavior is visible.
- Source: <https://datamarket.com>

METEOROLOGICAL DATA

AVERAGE MONTHLY TEMPERATURE (IN $^{\circ}F$) IN NOTTINGHAM

- The sample period is Jan 1920 – Dec 1939: Clearly visible seasonal pattern.
- Source: R datasets

METEOROLOGICAL DATA

AVERAGE MONTHLY TEMPERATURE (IN $^{\circ}F$) IN NOTTINGHAM

- Skip plot: annual time series for (four) individual months.
- No seasonal pattern visible.

CLIMATE SCIENCE DATA

INCREASE IN GLOBAL MEAN SEA LEVEL (IN *mm*) FROM 1992–2016

- Time series contains both trend and cyclical/seasonal component.
- Source: University of Colorado

CLIMATE SCIENCE DATA

INCREASE IN GLOBAL MEAN SEA LEVEL (IN *mm*) – ZOOMED IN

- Looking at the previous series more closely for 300 observations.

CLIMATE SCIENCE DATA

INCREASE IN GLOBAL MEAN SEA LEVEL – DETRENDED (CONSTANT AND LINEAR TREND)

- Detrended time series: Intercept and linear trend removed.
- Maybe not the “right” trend?

ECONOMICS

UNEMPLOYMENT RATE IN GERMANY, QUARTERLY DATA, 1969(1)–2014(2)

- Deseasonalized with X12-ARIMA or X13-ARIMA filter.
- Source: St. Louis FED

FINANCE

GERMAN STOCK MARKET INDEX DAX: NOV. 27, 1990 – SEPT. 30, 2016

- Different crashes clearly visible: Dotcom bubble (2002), global financial crisis (2007), euro crisis (2011).
- Source: Yahoo finance

CRIME STATISTICS DATA

DEATHS IN AUSTRALIA BY SUICIDE AND HOMICIDE (DEATHS PER 100,000)

- Annual data for 1915–2004.
- Source: <https://datamarket.com>

DEMOGRAPHIC DATA

TOTAL POPULATION AND FERTILITY IN GERMANY (ANNUAL DATA 1960–2014)
